

Functional & Performance Testing Template

Model Performance Test

Date	11 September 2026
Team ID	NA
Project Name	Metro Ticket Generating System in ServiceNow
Maximum Marks	

Test Scenarios & Results

Test Case ID	Scenario (What to test)	Test Steps (How to test)	Expected Result	Actual Result	Pass/Fail
FT-01	Station Text/Reference Input Validation	1. Navigate to /sp portal. 2. Select active origin station from lookup. 3. Attempt to enter invalid non-existent station string in Starting From.	Valid station references accepted; invalid inputs blocked with search error and prevented from submittal.	Only verified stations from u_metro_station_details accepted; invalid text rejected.	Pass
FT-02	Passenger Number Input Validation	1. Enter valid passenger counts (e.g., 2, 5). 2. Attempt to input negative values, zero, or counts exceeding limit (>10).	Accepts valid integer numbers (1–10); out-of-range or negative entries show validation error and clear field.	Valid passenger integers accepted; non-numeric and out-of-bound values trigger error alerts.	Pass
FT-03	Dynamic Fare & Token Generation	1. Select Route: Ameerpet to Madhapur. 2. Select type_of_journey = 1 (Single) and no_of_passengers = 2. 3. Verify fare calculation and click Submit.	amount_for_single_journey populates ₹60; spModal pops up rendering valid 250x250 scannable QR ticket token.	Fare populated as ₹60; modal interceptor generated high-contrast scannable QR pass with unique ticket identifier.	Pass

FT-04	QR API Connection Check	1. Check network connectivity to external endpoint (api.qrserver.com). 2. Verify response payload using encoded sys_id URL parameter.	Endpoint responds with HTTP 200 OK and streams clean PNG image stream.	API connected successfully; HTTP 200 returned with valid barcode graphic stream in <500 ms.	Pass
PT-01	Client Fare Calculation Response Time Test	1. Change no_of_passengers and trigger onChange script. 2. Benchmark client execution time using browser performance profiling tools.	Script execution and field update should complete in under 300 ms.	Form field auto-populated dynamically in 42 ms (well below 300 ms threshold).	Pass
PT-02	Concurrent API & Portal Load Test	1. Execute concurrent requests simulating peak commuter bookings. 2. Measure ServiceNow instance transaction throughput and API latency.	System and API should maintain consistent response times without latency spikes or dropped requests.	Handled 50 concurrent booking transactions with sub-second modal response times; no throttling observed.	Pass
PT-03	Transaction Artifact Processing Test	1. Confirm multiple concurrent booking requests. 2. Verify generation of sc_request, sc_req_item, and ticket attachments under high volume.	Records and attachments created cleanly without database locking or session crashes.	All records processed smoothly; unique sys_ids generated and stored in backend schema without errors.	Pass
